CLEARING HOUSE
Male Circumcision for HIV Prevention

Conclusive research shows that medical male circumcision substantially reduces men’s risk of acquiring HIV through vaginal sex, making it an important addition to HIV prevention strategies in eastern and southern Africa. Read more

Essential Reading

This publication was produced by the Communication for Change (C-Change) project and offers comprehensive guidance to communication programmes scaling up services in new settings. It outlines a 10-step, participatory process for adapting materials to make them appealing and relevant to new audiences.

This document outlines a five-year framework to guide accelerated scale-up of VMMC for HIV prevention in selected priority countries in eastern and southern Africa. It is intended for use by key stakeholders to collaborate and coordinate efforts across a range of interventions.

News & Events

Male circumcision for HIV prevention will be highlighted in more than 70 presentations and abstracts at the XIXth international AIDS Conference in Washington, DC. Find the full schedule and highlights here.
